

AI Digital Twin

Serverless RAG Chatbot on AWS

Muhammad Salman · Senior Infrastructure Consultant

 msalmansaeedch.de

What are your strengths?

My strengths include:

- **Consistency** — determined to solve complex tickets, however long it takes.
- **Passion for Cloud Computing** — it doesn't feel like a job to me.
- **Task Management** — highly organised, with clear visibility for my team.

✓ Answered live by the twin — grounded in real data

It retrieves before it speaks.

Nothing is generated from the model's own priors. Every answer is assembled from chunks of my CV that were actually retrieved for that question.

The parts I'd defend in a design review.

No NAT. No internet gateway.

The VPC is private subnets only. Lambda reaches Bedrock, Secrets Manager and S3 through VPC endpoints, so model and database traffic never touch the public internet — and the NAT bill is zero.

3 VPC endpoints • 0 egress paths

It defends itself.

A CloudWatch alarm on request volume fires a Lambda that drops the API stage throttle to zero. An abuse flood is rejected at the front door, unbilled — and it reopens automatically once traffic normalises.

ALARM → 0/0 • OK → 5/10

Keyless deploys.

GitHub Actions authenticates to AWS through OIDC — there is not a single static credential in the repo or in CI. Push to main and Terraform plans, applies and ships the Lambda bundles.

100% Terraform • 0 stored secrets

Updating what it knows is a git commit.

No dashboard, no re-training, no manual re-indexing. The knowledge base is version-controlled like the rest of the system.

Ask it anything about my cloud and platform engineering experience.
